An **infinite** set is a set whose members are endless.

e.g. a set of odd numbers, a set of all stars in the sky, a set of all integers.

Set K= {all prime numbers}

$$K = \{2, 3, 5, 7, 11, 13, \dots\}$$

W= {days of the week}

K = {square numbers}

P= {pupils who like football}

T = {multiples of three}

H = {all alphabetical letters}

$$\underline{\underline{r = 10}}$$

- (ii)  $n(A \text{ only})$

$$n(A \text{ only}) = 30 - r$$

$$= 30 - 10$$

$$\underline{\underline{= 20}}$$

- (c). If a member is picked at random, find the probability of selecting a member in  $(A \cap B)^I$

$$y = 28$$

*OR*

$$y + 20 - 13 = 35$$

$$y + 7 = 35$$

$$y + 7 - 7 = 35 - 7$$

$$y = 28$$

*OR*

$$y - 13 + 20 = 35$$

$$y + 7 = 35$$

$$y + 7 - 7 = 35 - 7$$

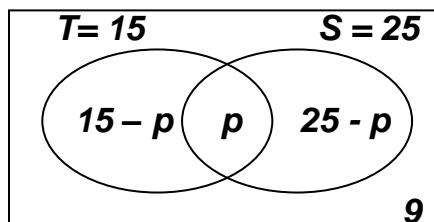

$$y = 28$$

*∴ 28 Pupils like mathematics*

5. In a group of 40 people, they all play football(F), 9 play football only, 15 play tennis(T) and football, 25 swim(S) and play football and some enjoy all the three games.

## SUB TOPIC: PROPERTIES OF NUMBERS

### DISTRIBUTIVE PROPERTY

Examples:

Use the distributive property to work out:

(i)  $(379 \times 27) + (27 \times 21)$

Re-arrange  $(27 \times 379) + (27 \times 21)$

$= 27 \times (379 + 21)$

$= 27 \times 400$

$= 27 \times 400$

$= 10800$

(ii)  $(137 \times 42) - (37 \times 42)$

$(137 \times 42) - (37 \times 42)$

$= (42 \times 137) - (42 \times 37)$

$= 42 \times (137 - 37)$

$= 42 \times 100$

$= 4200$

Mathematics is the key

## Workout the following;

1.  $(2 \times 17) + (2 \times 13)$
2.  $(75 \times 29) - (75 \times 19)$
3.  $(129 \times 37) - (129 \times 27)$
4.  $(290 \div 70) - (10 \div 70)$
5.  $(179 \div 13) - (10 \div 13)$

## ASSOCIATIVE PROPERTY

Example

**The alteration of the position of the brackets does not change the result.**

Use the associative property to workout

$$(5+8)+2 = 5+(8+2) = (5+2)+8$$

$$\begin{array}{rcl} 13+2 & = & 5+10 \\ 15 & = & 15 \end{array} = \begin{array}{rcl} 7+8 \\ 15 \end{array}$$

The alteration of the position of the brackets does not change the result.

$$(5 \times 8) \times 2 = 5 \times (8 \times 2) = (5 \times 2) + 8$$

$$\begin{array}{rcl} 40 \times 2 & = & 5 \times 16 \\ 80 & = & 80 \end{array} = \begin{array}{rcl} 10 \times 8 \\ 80 \end{array}$$

**Conclusion :** the associative property holds for both addition and multiplication

## COMMUTATIVE PROPERTY

Example

$$4+3 = 3+4 \quad (\text{What you start with does not affect the result})$$

$$\begin{array}{rcl} 7 & & 7 \end{array}$$

$$4 \times 3 = 3 \times 4 \quad (\text{What you start with does not affect the result})$$

$$12 = 12$$

**Conclusion:** The commutative property holds for both addition and multiplication

# PATTERNS AND SEQUENCES

## SUB TOPIC: DIVISIBILITY TESTS

### Divisibility for 2.

A Number is divisible by 2 if the digit in the one's place is 0, 2, 4, 6, or 8 eg 1460

### Test for 3:

A number is divisible by 3 if the sum of its digits is divisible by 3 eg  $741 = 7 + 4 + 1 = 12$

### Test for 4:

A number is divisible by 4 if the number formed by its last two digits is divisible by 4. eg 572. The last two digits are 7 and 2 therefore the number formed is 72 which is divisible by 4. Hence 572 is divisible by 4.

### Test for five (5):

A number is divisible by 5 if the last digit in the ones place is either 0 or 5. eg 360 or 805.

### Activity

1. Write any two numbers divisible by 2
2. Which of the numbers is divisible by 3

34

236

11190

2783

3. Which of the numbers is divisible by 4

4612

139

8500

7869

### Test for 6:

A number is divisible by 6 if it is divisible by 2 and 3. In other words a number is divisible by 6 if it is even and the sum of its digits is divisible by 3.

#### **Example:**

618 is divisible by 6 since it is an even number and the sum of its digits  $6 + 1 + 8 = 15$  is divisible by 3.

738 is divisible by 6 since it is an even number and the sum of its digits  $7 + 3 + 8 = 18$  is divisible by 3. Therefore 738 is divisible by 6.

### Test for 7:

When the last digit of a number is doubled and the result is subtracted from the number formed by the remaining digits, the outcome is divisible by 7.

**Example:** Take the number 861. the last digit is 1 and the number formed by the remaining digits is 86, double 1 to give  $(1+1)=2$

Mathematics is the key

Subtract 2 from 86 to give  $(86 - 2) = 84$   
84 is divisible by 7. Hence 861 is also divisible by 7.

### **Test for 8:**

A number is divisible by 8 if the number formed by the last three digits is divisible by 8.

Example:

In the number 7960,760 the number formed by the last three digits. It is divisible by 8 therefore 7960 is divisible by 8.

### **Test for 9:**

A number is divisible by 9 if the sum of its digits is divisible by 9.

Example: 198 the sum of 198 is  $1+9+8 = 18$

18 is divisible by 9 therefore 198 is divisible by 9.

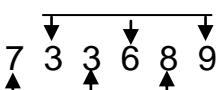

### **Test for 10:**

A number is divisible by 10 if the digit in the ones place is 0 eg 70, 60, 120, 3010.

A number which is divisible by 10 is also divisible by 2 and 5.

### **Test for 11:**

A number is divisible by 11 if the difference between the sum of the digits in even places and the sum of the digits in the odd place is zero (0) or divisible by 11.

eg Even position:      

Odd position

Sum of the numbers in odd positions =  $7 + 3 + 8 = 18$

Sum of the numbers in even positions =  $3 + 6 + 9 = 18$

Difference between sums =  $18 - 18 = 0$

Since difference is divisible by 11

$\therefore$  the number 676390 is divisible by 11.

### **Activity**

### **SUB TOPIC: Finding SP when percentage profit/loss and CP are given**

#### **REMEMBER**

- The cost price (CP) is the old number.
- The selling price(SP) is the new number.
- When given percentage increase, increase the old number(CP) to get the new number(SP).

*If the %ge profit is k%*

$$\frac{100\% + k\%}{100} \times CP = SP$$

- When given percentage decrease, decrease the old number(CP) to get the new number(SP).

*If the %ge loss is m%*

$$\frac{100\% - m\%}{100} \times CP = SP$$

#### **Examples**

1. After selling a shirt which he bought at sh.8,000, the shopkeeper made a profit of 20%. How much money did he sell the shirt?

$$SP = \frac{100 + 20}{100} \times sh. 8,000$$

$$\frac{120}{100} \times sh. 8,000$$

$$120 \times sh. 80$$

$$\underline{sh. 9,600}$$

Mathematics is the key

2. James bought a goat at sh.120,000 and later sold it at a loss of 10%, how much did he get after selling the goat?

$$SP = \frac{100 - 10}{100} \times sh. 120,000$$

$$\frac{90}{100} \times sh. 120,000$$

$$90 \times sh. 1,200$$

 4. After selling a tray of eggs, a farmer made a profit of 5%. At what price did he sell the tray of eggs if the cost price of the tray of eggs is sh.9,000.

**SUB TOPIC: Finding CP when percentage profit and SP are given**

Examples:

1. After selling a pair of shoes at sh. 21,000, a trader made a profit of 20%. Find the buying price of the pair of shoes.

$$Cost\ price\ as\ a\ percentage = 100\%$$

$$Selling\ price\ as\ a\ percentage = 100\% + 20\% = 120\%$$

$$120\% \ represents = sh. 21,000$$

$$1\% \ represents = \frac{shs. 21000}{120}$$

$$100\% \ represents = \frac{shs. 700}{4} \times 100 \\ = (25 \times 700) \\ \underline{\underline{= shs. 17,500}}$$

2. a) By selling a blanket at sh. 36000, a trader made a profit of 20%. Calculate the cost price of the blanket

**SUB TOPIC:** Finding CP when percentage loss and SP are given

1. By selling his cow at sh. 34,000, Obala made a loss of 15%. How much did the cow cost?

$$\text{Loss} = 15\%$$

$$SP = 100\% - 15\%$$

$$= 85\%$$

$$85\% \text{ of } CP = shs. 34,000$$

$$\frac{85}{100} CP = shs. 34,000$$

$$100 \times \frac{85cp}{100} = shs. 34,000 \times 100$$

$$85cp = shs. 3,400,000$$

$$\frac{85cp}{85} = \frac{shs. 3,400,000}{85}$$

Mathematics is the key

$$\text{discount} = MP - CP$$

**MP** = *Marked price*

#### Example 1:

A Scientist was born in 30BC and died immediately after his birthday in 76AD. How old was he when he died?

The man lived from -30 to +76

$$\begin{aligned} \text{The Scientist lived for } & +76 - (-30) \\ & = 76 + 30 \\ & = \underline{\underline{106 \text{ years}}} \end{aligned}$$

#### Example 2

The temperature of a drink dropped from  $10^{\circ}\text{C}$  to  $-4^{\circ}\text{C}$ . By how many degrees did drop?

Old temp =  $10^{\circ}\text{C}$

New temp =  $-4^{\circ}\text{C}$ .

The temp. of the drink dropped by  $10^{\circ}\text{C} - (-4^{\circ}\text{C})$

$$\begin{aligned} & = 10^{\circ}\text{C} + 4^{\circ}\text{C} \\ & = \underline{\underline{14^{\circ}\text{C}}} \end{aligned}$$

#### Example 3

A teacher awards 4 marks for every correct answer and deducts a mark for every wrong answer.

(a). If a pupils gets 12 correct answers in a test of 20 numbers, how many marks does he get ?

Correct answers = 12

Wrong answers =  $20 - 12$

$$\underline{\underline{= 8}}$$

$$\begin{aligned} \text{Marks scored} & = (12 \times 4) - (8 \times 1) \\ & = 48 - 8 \\ & = \underline{\underline{40}} \end{aligned}$$

(b). If pupil gets 60 marks in a test of 30 questions, how wrong answers will he have got?

**Let the wrong answers be  $m$**

**Correct answers =  $30 - m$**

$$4(30 - m) - (mx1) = 60$$

$$120 - 4m - m = 60$$

$$120 - 5m = 60$$

$$120 - 120 - 5m = 60 - 120$$

$$-5m = -60$$

$$\frac{-5m}{-5} = \frac{-60}{-5}$$

$$\underline{m = 12 \text{ wrong answers}}$$

$$\frac{80 + 6m + 180 + 210}{14} = 55$$
$$14 \times \frac{6m + 470}{14} = 55 \times 14$$
$$6m + 470 = 770$$
$$6m + 470 - 470 = 770 - 470$$
$$6m = 300$$

### **(a) Poles in a straight line (Open fences)**

*In open fences, the number of poles is one more than the number of spaces*

**There are 11 poles and 10 spaces in the figure above**
